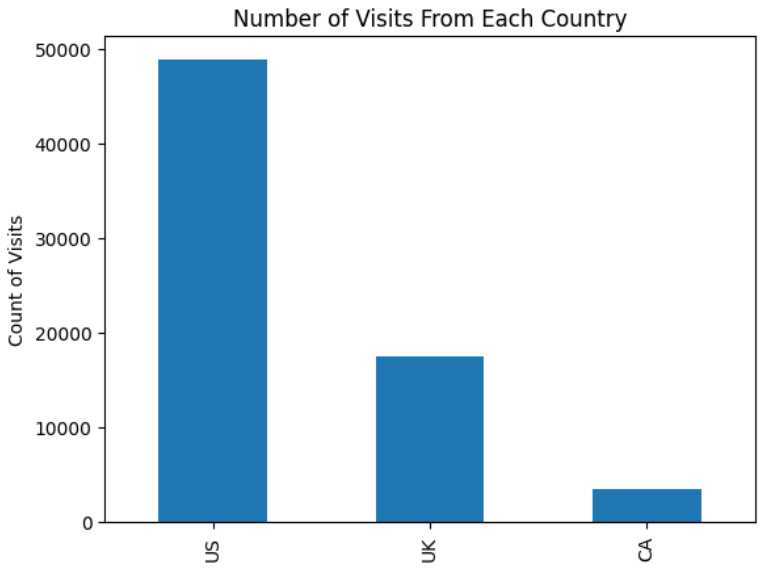
How Was The Experiment Implemented?

Total Variant Visitors: 35,211

Total Control Participants: 34,678



Conversion Rates

	U.S.	U.K.	CA
Control	**10.73%**	**10.16%**	**9.45%**
Treatment	**15.78%**	**14.87%**	**15.40%**

Executive Summary: The treatment page outperforms the control page by approximately 5 percentage points across all three countries. The improvement is consistent regardless of geography, suggesting the new page design — not country — is driving the difference.

Experiment Results

Treatment Conversion Rate: 15.63%
Control Conversion Rate: 10.53%
Delta in Treatment vs. Control Conversion Rate: +5.00 percentage points
p-value: 0.0
Conclusion: The p-value is 0.0, well below the 0.05 threshold. We reject the null hypothesis. The treatment page produces a statistically significant improvement in conversion. The company should implement the new page.

Country Results

Logistic Regression p-values:

US: 0.1701 — not statistically significant
UK: 0.9048 — not statistically significant
Baseline: CA

Conclusion: Country does not significantly predict conversion when controlling for page type. The treatment effect is consistent across the US, UK, and Canada. No country-specific page strategy is needed — a single global rollout of the new page is appropriate.
